Novel isolated G-protein coupled receptor peptide useful for treating disorder characterised by absence of, in appropriate or unwanted expression of the receptor protein, and as immunogens to raise antibodies

Claim 23; Fig 3; 64pp; English.

The present specifically claimed human genomic DNA sequence (located on chromosome 13) encodes a purinergic-related G-protein coupled receptor (GPCR) of the invention. GPCRs constitute a major class of proteins responsible for signal transduction within a cell. Upon binding of a ligand to the extracellular portion of a GPCR, a signal is transduced resulting in a biological or physiological change within the cell. The GPCR proteins can be divided into five families, family I contains the purinergic GPCRs (e.g. the P2Y receptors). P2Y receptors are characterised by their selective responsiveness towards ATP and its analogues, some also respond to UTP. The invention comprises a human G-protein coupled receptor protein and encoding nucleic acids. The GPCR protein and nucleic acids of the invention are useful in the treatment of a disease or condition mediated by a human protease. The GPCR protein of the invention is useful for the development/identification of therapeutic proteins; assays designed to quantitatively determine levels of the protein in biological fluids; identifying compounds which modulate the activity of the GPCR, or the interaction of the GPCR and a molecule with which it normally interacts; and treating a disorder characterised by an absence of, or inappropriate expression of the GPCR protein. The GPCR nucleic acids of the invention are useful in: diagnostic assays to identify changes in the GPCR nucleic acid that lead to pathology; controlling GPCR expression; and in gene therapy to treat patients with aberrant GPCR gene expression. The GPCR nucleic acids can also be used in the production of transgenic animals.

(I) is useful for:
(a) assessing whether a patient is affilicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    prostate

Novel isolated nucleic acid molecule associated with cancerous state of prostate cells and correlating with presence of prostate cancer, useful for detecting presence of prostate cancer -Page 6487-6488; 11750pp; English

WPI;

2001-662795/76.

The invention relates to an isolated nucleic acid molecule (I) a nucleotide sequence given in Tables 1-9 (ABV00010-ABV62213) o) comprising of the

sequence

is that

asthma, Novel human P2Y1-like G protein-coupled receptor polypeptide which can be regulated for treating infection, pain, cancer, diabetes, anorexia, hypertension, neurological disorder and dyskinesia

Claim 1; Fig 5; 118pp; English

CC receptor (GPCR) polypeptide and the nucleic acids encouring a conceptor (GPCR) polypeptide and the nucleic acids encouring a conceptor (GPCR) polypeptide and as sequences, promoters, fragments, variants, or a conceptor (GPCR) and 3 sequences, promoters, fragments, variants, or a sequence encoding a protein at least 50% identical to the GPCR).

CC Also included are an expression vector comprising the nucleic acid, conception and the identification of modulators of the GPCR each of a suspension vector and the identification of modulators of the GPCR and is useful for detecting a polymucleotide encoding the GPCR in a biological sample. The GPCR and nucleic acid are useful for for modulators of the GPCR. The modulator or agent useful for modulators of the GPCR. The modulator or agent useful for modulating contral for modulators of the GPCR. The modulator or agent useful for modulating bacterial, fungal, protozoan, and viral infection, pain, cancer.

CC anorexia, bulimia, asthma, central nervous system (CNS) disease, acute bacterial fungal, protosoan, and viral infection, pain, cancer, acute costeoporosis, diabettes, angina pectoris, mycardial infarction, ulcer, osteoporosis, diabettes, angina pectoris, benign prostatic hypertrophy, companied the protosoan of the GPCR. The section of the GPCR and neurological disorders, dyskinesias, HIV virus infection companied the contral infarction and peurological disorders such as parkinson's contral and contral protocons and prostatic hypertrophy, schizophrenia, manic depression, delirium, dementia, RESULT 11

New G-protein coupled receptor (GPCR) polypeptide with homology to P2Y purinoreceptor, useful for treating e.g. inflammation or cancers in a patient, or for screening GPCR agonists or antagonists for treating diseases

Claim 1; Page 12; 19pp; English

The invention relates to a novel G-protein coupled receptor (GPCR), and the polynucleotide encoding it. The protein of the invention has neuroprotective, anti-inflammatory, cytoscatic, cardiovascular, antiallergic, hypotensive, antiarteriosclerotic, and osteopathic activity. The GPCR polypeptide is useful for manufacturing a medicament for treating a patient who needs to upregulate a receptor. Preferably, therapeutically useful areas are hypertension, asthma, and artherosclerosis. The sequence encodes the G-protein coupled receptor of the invention, PFI-019.

emphysems, Grave's disease, gout, multiple sclerosis, rheumatoid arthritis, systemic lupus erythematosus, uveitis, viral, bacterial, fungal, parasitic, protozoal and helminthic infections and trauma, metabolic disorders such as diabetes, obesity and osteoporosis; and viral infections such as infection caused by viral agent classified a adenovirus, arenavirus, bunyavirus. Polynucleotides of the invention are useful as probes for assessing toxicity of test compounds. They a also used in gene therapy. The present sequence is human G-protein coupled receptor 2 (GCREC-2) cDNA.

GCREC polypeptides are useful for screening compounds that modulate their activity. They are useful in the diagnosts, prevention and treatment of disorders which include cell proliferative disorders such as arteriosclerosis, hepatitis, myelofibrosis, psoriasis and cancer including adenocarcinoma, leuka
                                                                                                                                                                                                                                                                                                                                                                                     lymphoma; neurological disorders such as epilepsy, ischaemic cerebrovascular disease, Alzheimer's disease, Pick's disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  308,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         USA
                adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gli4732114 [gb]AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                         (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant very. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /lab_host="E. coli strain XL10-Gold, T1-resistant, F-"
